This API documentation describes Spring Boot Actuators web endpoints.
Chapter 1. Overview

Before you proceed, you should read the following topics:

- URLs
- Timestamps

In order to get the correct JSON responses documented below, Jackson must be available.

1.1. URLs

By default, all web endpoints are available beneath the path /actuator with URLs of the form /actuator/{id}. The /actuator base path can be configured by using the management.endpoints.web.base-path property, as shown in the following example:

```application.properties```
management.endpoints.web.base-path=/manage
```

The preceding application.properties example changes the form of the endpoint URLs from /actuator/{id} to /manage/{id}. For example, the URL info endpoint would become /manage/info.

1.2. Timestamps

All timestamps that are consumed by the endpoints, either as query parameters or in the request body, must be formatted as an offset date and time as specified in ISO 8601.
Chapter 2. Audit Events (auditevents)

The auditevents endpoint provides information about the application’s audit events.

2.1. Retrieving Audit Events

To retrieve the audit events, make a GET request to /actuator/auditevents, as shown in the following curl-based example:

```
$ curl 'http://localhost:8080/actuator/auditevents?principal=alice&after=2021-06-10T07%3A26%3A38.367Z&type=logout' -i -X GET
```

The preceding example retrieves logout events for the principal, alice, that occurred after 09:37 on 7 November 2017 in the UTC timezone. The resulting response is similar to the following:

```
HTTP/1.1 200 OK
Content-Type: application/vnd.spring-boot.actuator.v3+json
Content-Length: 121

{
   "events" : [ {
      "timestamp" : "2021-06-10T07:26:38.367Z",
      "principal" : "alice",
      "type" : "logout"
   } ]
}
```

2.1.1. Query Parameters

The endpoint uses query parameters to limit the events that it returns. The following table shows the supported query parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>after</td>
<td>Restricts the events to those that occurred after the given time. Optional.</td>
</tr>
<tr>
<td>principal</td>
<td>Restricts the events to those with the given principal. Optional.</td>
</tr>
<tr>
<td>type</td>
<td>Restricts the events to those with the given type. Optional.</td>
</tr>
</tbody>
</table>

2.1.2. Response Structure

The response contains details of all of the audit events that matched the query. The following table describes the structure of the response:
<table>
<thead>
<tr>
<th>Path</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>events</td>
<td>Array</td>
<td>An array of audit events.</td>
</tr>
<tr>
<td>events[].timestamp</td>
<td>String</td>
<td>The timestamp of when the event occurred.</td>
</tr>
<tr>
<td>events[].principal</td>
<td>String</td>
<td>The principal that triggered the event.</td>
</tr>
<tr>
<td>events[].type</td>
<td>String</td>
<td>The type of the event.</td>
</tr>
</tbody>
</table>
Chapter 3. Beans *(beans)*

The *beans* endpoint provides information about the application's beans.

3.1. Retrieving the Beans

To retrieve the beans, make a **GET** request to /actuator/beans, as shown in the following curl-based example:

```
$ curl 'http://localhost:8080/actuator/beans' -i -X GET
```

The resulting response is similar to the following:
3.1.1. Response Structure

The response contains details of the application’s beans. The following table describes the structure of the response:
<table>
<thead>
<tr>
<th>Path</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>contexts</td>
<td>Object</td>
<td>Application contexts keyed by id.</td>
</tr>
<tr>
<td>contexts.*.parentId</td>
<td>String</td>
<td>Id of the parent application context, if any.</td>
</tr>
<tr>
<td>contexts.*.beans</td>
<td>Object</td>
<td>Beans in the application context keyed by name.</td>
</tr>
<tr>
<td>contexts.<em>.beans.</em>.aliases</td>
<td>Array</td>
<td>Names of any aliases.</td>
</tr>
<tr>
<td>contexts.<em>.beans.</em>.scope</td>
<td>String</td>
<td>Scope of the bean.</td>
</tr>
<tr>
<td>contexts.<em>.beans.</em>.type</td>
<td>String</td>
<td>Fully qualified type of the bean.</td>
</tr>
<tr>
<td>contexts.<em>.beans.</em>.resource</td>
<td>String</td>
<td>Resource in which the bean was defined, if any.</td>
</tr>
<tr>
<td>contexts.<em>.beans.</em>.dependencies</td>
<td>Array</td>
<td>Names of any dependencies.</td>
</tr>
</tbody>
</table>
Chapter 4. Caches (**caches**)

The **caches** endpoint provides access to the application’s caches.

### 4.1. Retrieving All Caches

To retrieve the application’s caches, make a **GET** request to `/actuator/caches`, as shown in the following curl-based example:

```bash
$ curl 'http://localhost:8080/actuator/caches' -i -X GET
```

The resulting response is similar to the following:

```
HTTP/1.1 200 OK
Content-Type: application/vnd.spring-boot.actuator.v3+json
Content-Length: 435

{
   "cacheManagers" : {
      "anotherCacheManager" : {
         "caches" : {
            "countries" : {
               "target" : "java.util.concurrent.ConcurrentHashMap"
            }
         }
      },
      "cacheManager" : {
         "caches" : {
            "cities" : {
               "target" : "java.util.concurrent.ConcurrentHashMap"
            },
            "countries" : {
               "target" : "java.util.concurrent.ConcurrentHashMap"
            }
         }
      }
   }
}
```

### 4.1.1. Response Structure

The response contains details of the application’s caches. The following table describes the structure of the response:

<table>
<thead>
<tr>
<th>Path</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cacheManagers</td>
<td>Object</td>
<td>Cache managers keyed by id.</td>
</tr>
<tr>
<td>Path</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>----------</td>
<td>-------------------------------------------------------</td>
</tr>
<tr>
<td>cacheManagers.*.caches</td>
<td>Object</td>
<td>Caches in the application context keyed by name.</td>
</tr>
<tr>
<td>cacheManagers.<em>.caches.</em>.target</td>
<td>String</td>
<td>Fully qualified name of the native cache.</td>
</tr>
</tbody>
</table>

### 4.2. Retrieving Caches by Name

To retrieve a cache by name, make a **GET** request to `/actuator/caches/{name}`, as shown in the following curl-based example:

```sh
$ curl 'http://localhost:8080/actuator/caches/cities' -i -X GET
```

The preceding example retrieves information about the cache named `cities`. The resulting response is similar to the following:

```json
HTTP/1.1 200 OK
Content-Type: application/vnd.spring-boot.actuator.v3+json
Content-Length: 113

{
    "target": "java.util.concurrent.ConcurrentHashMap",
    "name": "cities",
    "cacheManager": "cacheManager"
}
```

### 4.2.1. Query Parameters

If the requested name is specific enough to identify a single cache, no extra parameter is required. Otherwise, the `cacheManager` must be specified. The following table shows the supported query parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cacheManager</td>
<td>Name of the cacheManager to qualify the cache. May be omitted if the cache name is unique.</td>
</tr>
</tbody>
</table>

### 4.2.2. Response Structure

The response contains details of the requested cache. The following table describes the structure of the response:

<table>
<thead>
<tr>
<th>Path</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Cache name.</td>
</tr>
<tr>
<td>cacheManager</td>
<td>String</td>
<td>Cache manager name.</td>
</tr>
</tbody>
</table>
4.3. Evict All Caches

To clear all available caches, make a DELETE request to /actuator/caches as shown in the following curl-based example:

```
$ curl 'http://localhost:8080/actuator/caches' -i -X DELETE
```

4.4. Evict a Cache by Name

To evict a particular cache, make a DELETE request to /actuator/caches/{name} as shown in the following curl-based example:

```
$ curl 'http://localhost:8080/actuator/caches/countries?cacheManager=anotherCacheManager' -i -X DELETE
```

As there are two caches named countries, the cacheManager has to be provided to specify which Cache should be cleared.

4.4.1. Request Structure

If the requested name is specific enough to identify a single cache, no extra parameter is required. Otherwise, the cacheManager must be specified. The following table shows the supported query parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cacheManager</td>
<td>Name of the cacheManager to qualify the cache. May be omitted if the cache name is unique.</td>
</tr>
</tbody>
</table>
Chapter 5. Conditions Evaluation Report (conditions)

The conditions endpoint provides information about the evaluation of conditions on configuration and auto-configuration classes.

5.1. Retrieving the Report

To retrieve the report, make a GET request to /actuator/conditions, as shown in the following curl-based example:

```bash
$ curl 'http://localhost:8080/actuator/conditions' -i -X GET
```

The resulting response is similar to the following:

```
HTTP/1.1 200 OK
Content-Type: application/vnd.spring-boot.actuator.v3+json
Content-Length: 3255

{
  "contexts" : {
    "application" : {
      "positiveMatches" : {
        "EndpointAutoConfiguration#endpointOperationParameterMapper" : [ {
          "condition" : "OnBeanCondition",
          "message" : "@ConditionalOnMissingBean (types: org.springframework.boot.actuate.endpoint.invoke.ParameterValueMapper; SearchStrategy: all) did not find any beans"
        } ],
        "EndpointAutoConfiguration#endpointCachingOperationInvokerAdvisor" : [ {
          "condition" : "OnBeanCondition",
          "message" : "@ConditionalOnMissingBean (types: org.springframework.boot.actuate.endpoint.invoker.cache.CachingOperationInvokerAdvisor; SearchStrategy: all) did not find any beans"
        } ],
        "WebEndpointAutoConfiguration" : [ {
          "condition" : "OnWebApplicationCondition",
          "message" : "@ConditionalOnWebApplication (required) found 'session' scope"
        } ]
      },
      "negativeMatches" : {
        "WebFluxEndpointManagementContextConfiguration" : {
          "notMatched" : [ {
            "condition" : "OnWebApplicationCondition",
            "message" : "not a reactive web application"
          } ],
          "matched" : [ {
```
5.1.1. Response Structure

The response contains details of the application's condition evaluation. The following table describes the structure of the response:
<table>
<thead>
<tr>
<th>Path</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>contexts</td>
<td>Object</td>
<td>Application contexts keyed by id.</td>
</tr>
<tr>
<td>contexts.*.positiveMatches</td>
<td>Object</td>
<td>Classes and methods with conditions that were matched.</td>
</tr>
<tr>
<td>contexts.<em>.positiveMatches.</em>.condition</td>
<td>String</td>
<td>Name of the condition.</td>
</tr>
<tr>
<td>contexts.<em>.positiveMatches.</em>.message</td>
<td>String</td>
<td>Details of why the condition was matched.</td>
</tr>
<tr>
<td>contexts.*.negativeMatches</td>
<td>Object</td>
<td>Classes and methods with conditions that were not matched.</td>
</tr>
<tr>
<td>contexts.<em>.negativeMatches.</em>.notMatched</td>
<td>Array</td>
<td>Conditions that were matched.</td>
</tr>
<tr>
<td>contexts.<em>.negativeMatches.</em>.notMatched.*.condition</td>
<td>String</td>
<td>Name of the condition.</td>
</tr>
<tr>
<td>contexts.<em>.negativeMatches.</em>.notMatched.*.message</td>
<td>String</td>
<td>Details of why the condition was not matched.</td>
</tr>
<tr>
<td>contexts.<em>.negativeMatches.</em>.matched</td>
<td>Array</td>
<td>Conditions that were matched.</td>
</tr>
<tr>
<td>contexts.<em>.negativeMatches.</em>.matched.*.condition</td>
<td>String</td>
<td>Name of the condition.</td>
</tr>
<tr>
<td>contexts.<em>.negativeMatches.</em>.matched.*.message</td>
<td>String</td>
<td>Details of why the condition was matched.</td>
</tr>
<tr>
<td>contexts.*.unconditionalClasses</td>
<td>Array</td>
<td>Names of unconditional auto-configuration classes if any.</td>
</tr>
<tr>
<td>contexts.*.parentId</td>
<td>String</td>
<td>Id of the parent application context, if any.</td>
</tr>
</tbody>
</table>
Chapter 6. Configuration Properties (configprops)

The configprops endpoint provides information about the application's @ConfigurationProperties beans.

6.1. Retrieving the @ConfigurationProperties Bean

To retrieve the @ConfigurationProperties beans, make a GET request to /actuator/configprops, as shown in the following curl-based example:

```
$ curl 'http://localhost:8080/actuator/configprops' -i -X GET
```

The resulting response is similar to the following:

```
HTTP/1.1 200 OK
Content-Type: application/vnd.spring-boot.actuator.v3+json
Content-Length: 3178

{
  "contexts": {
    "application": {
      "beans": {
        "management.endpoints.web.cors-
org.springframework.boot.actuate.autoconfigure.endpoint.web.CorsEndpointProperties": {
          "prefix": "management.endpoints.web.cors",
          "properties": {
            "allowedHeaders": [ ],
            "allowedMethods": [ ],
            "allowedOrigins": [ ],
            "maxAge": "PT30M",
            "exposedHeaders": [ ]
          },
          "inputs": {

      "staticLocations" : [ "classpath:/META-INF/resources/",
        "classpath:/resources/", "classpath:/static/", "classpath:/public/" ],
      "addMappings" : true,
      "chain" : {
        "cache" : true,
        "compressed" : false,
        "strategy" : {
          "fixed" : {
            "enabled" : false,
            "paths" : [ "/**" ]
          },
          "content" : {
            "enabled" : false,
            "paths" : [ "/**" ]
          }
        },
        "cache" : {
          "cachecontrol" : { },
          "useLastModified" : true
        }
      }
    }
  },
### 6.1.1. Response Structure

The response contains details of the application's `@ConfigurationProperties` beans. The following table describes the structure of the response:

<table>
<thead>
<tr>
<th>Path</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>contexts</td>
<td>Object</td>
<td>Application contexts keyed by id.</td>
</tr>
<tr>
<td>contexts.<em>.beans.</em></td>
<td>Object</td>
<td><code>@ConfigurationProperties</code> beans keyed by bean name.</td>
</tr>
<tr>
<td>contexts.<em>.beans.</em>.prefix</td>
<td>String</td>
<td>Prefix applied to the names of the bean's properties.</td>
</tr>
<tr>
<td>contexts.<em>.beans.</em>.properties</td>
<td>Object</td>
<td>Properties of the bean as name-value pairs.</td>
</tr>
<tr>
<td>contexts.<em>.beans.</em>.inputs</td>
<td>Object</td>
<td>Origin and value of the configuration property used when binding to this bean.</td>
</tr>
<tr>
<td>contexts.*.parentId</td>
<td>String</td>
<td>Id of the parent application context, if any.</td>
</tr>
</tbody>
</table>
Chapter 7. Environment (env)

The env endpoint provides information about the application's Environment.

7.1. Retrieving the Entire Environment

To retrieve the entire environment, make a GET request to /actuator/env, as shown in the following curl-based example:

```
$ curl 'http://localhost:8080/actuator/env' -i -X GET
```

The resulting response is similar to the following:
HTTP/1.1 200 OK
Content-Type: application/vnd.spring-boot.actuator.v3+json
Content-Length: 825

{
   "activeProfiles" : [ ],
   "propertySources" : [ {
      "name" : "systemProperties",
      "properties" : {
         "java.runtime.name" : {
            "value" : "OpenJDK Runtime Environment"
         },
         "java.vm.version" : {
            "value" : "25.292-b10"
         },
         "java.vm.vendor" : {
            "value" : "AdoptOpenJDK"
         }
      }
   }, {
      "name" : "systemEnvironment",
      "properties" : {
         "JAVA_HOME" : {
            "value" : "/opt/openjdk",
            "origin" : "System Environment Property JAVA_HOME"
         }
      }
   }, { 
      "name" : "Config resource 'class path resource [application.properties]' via location 'classpath:'",
      "properties" : {
         "com.example.cache.max-size" : {
            "value" : "1000",
            "origin" : "class path resource [application.properties] - 1:29"
         }
      }
   }]}

7.1.1. Response Structure

The response contains details of the application’s Environment. The following table describes the structure of the response:

<table>
<thead>
<tr>
<th>Path</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>activeProfiles</td>
<td>Array</td>
<td>Names of the active profiles, if any.</td>
</tr>
<tr>
<td>propertySources</td>
<td>Array</td>
<td>Property sources in order of precedence.</td>
</tr>
</tbody>
</table>
### 7.2. Retrieving a Single Property

To retrieve a single property, make a **GET** request to `/actuator/env/{property.name}`, as shown in the following curl-based example:

```
$ curl 'http://localhost:8080/actuator/env/com.example.cache.max-size' -i -X GET
```

The preceding example retrieves information about the property named `com.example.cache.max-size`. The resulting response is similar to the following:

```
HTTP/1.1 200 OK
Content-Disposition: inline;filename=f.txt
Content-Type: application/vnd.spring-boot.actuator.v3+json
Content-Length: 517

{
    "property" : {
        "source" : "Config resource 'class path resource [application.properties]' via location 'classpath://'",
        "value" : "1000"
    },
    "activeProfiles" : [],
    "propertySources" : [{
        "name" : "systemProperties"
    }, {
        "name" : "systemEnvironment"
    }, {
        "name" : "Config resource 'class path resource [application.properties]' via location 'classpath://'",
        "property" : {
            "value" : "1000",
            "origin" : "class path resource [application.properties] - 1:29"
        }
    }]
}
```
### 7.2.1. Response Structure

The response contains details of the requested property. The following table describes the structure of the response:

<table>
<thead>
<tr>
<th>Path</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>property</td>
<td>Object</td>
<td>Property from the environment, if found.</td>
</tr>
<tr>
<td>property.source</td>
<td>String</td>
<td>Name of the source of the property.</td>
</tr>
<tr>
<td>property.value</td>
<td>String</td>
<td>Value of the property.</td>
</tr>
<tr>
<td>activeProfiles</td>
<td>Array</td>
<td>Names of the active profiles, if any.</td>
</tr>
<tr>
<td>propertySources</td>
<td>Array</td>
<td>Property sources in order of precedence.</td>
</tr>
<tr>
<td>propertySources.[].name</td>
<td>String</td>
<td>Name of the property source.</td>
</tr>
<tr>
<td>propertySources.[].property</td>
<td>Object</td>
<td>Property in the property source, if any.</td>
</tr>
<tr>
<td>propertySources.[].property.value</td>
<td>Varies</td>
<td>Value of the property.</td>
</tr>
<tr>
<td>propertySources.[].property.origin</td>
<td>String</td>
<td>Origin of the property, if any.</td>
</tr>
</tbody>
</table>
Chapter 8. Flyway (flyway)

The flyway endpoint provides information about database migrations performed by Flyway.

8.1. Retrieving the Migrations

To retrieve the migrations, make a GET request to /actuator/flyway, as shown in the following curl-based example:

```bash
$ curl 'http://localhost:8080/actuator/flyway' -i -X GET
```

The resulting response is similar to the following:

```json
HTTP/1.1 200 OK
Content-Type: application/vnd.spring-boot.actuator.v3+json
Content-Length: 515

{
   "contexts": {
      "application": {
         "flywayBeans": {
            "flyway": {
               "migrations": [ {
                  "type": "SQL",
                  "checksum": -156244537,
                  "version": "1",
                  "description": "init",
                  "script": "V1__init.sql",
                  "state": "SUCCESS",
                  "installedBy": "SA",
                  "installedOn": "2021-06-10T07:26:37.403Z",
                  "installedRank": 1,
                  "executionTime": 3
               } ]
            }
         }
      }
   }
}
```

8.1.1. Response Structure

The response contains details of the application’s Flyway migrations. The following table describes the structure of the response:
<table>
<thead>
<tr>
<th>Path</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>contexts</td>
<td>Object</td>
<td>Application contexts keyed by id</td>
</tr>
<tr>
<td>contexts.<em>.flywayBeans.</em>.migrations</td>
<td>Array</td>
<td>Migrations performed by the Flyway instance, keyed by Flyway bean name.</td>
</tr>
<tr>
<td>contexts.<em>.flywayBeans.</em>.migrations[].checksum</td>
<td>Number</td>
<td>Checksum of the migration, if any.</td>
</tr>
<tr>
<td>contexts.<em>.flywayBeans.</em>.migrations[].description</td>
<td>String</td>
<td>Description of the migration, if any.</td>
</tr>
<tr>
<td>contexts.<em>.flywayBeans.</em>.migrations[].executionTime</td>
<td>Number</td>
<td>Execution time in milliseconds of an applied migration.</td>
</tr>
<tr>
<td>contexts.<em>.flywayBeans.</em>.migrations[].installedBy</td>
<td>String</td>
<td>User that installed the applied migration, if any.</td>
</tr>
<tr>
<td>contexts.<em>.flywayBeans.</em>.migrations[].installedOn</td>
<td>String</td>
<td>Timestamp of when the applied migration was installed, if any.</td>
</tr>
<tr>
<td>contexts.<em>.flywayBeans.</em>.migrations[].installedRank</td>
<td>Number</td>
<td>Rank of the applied migration, if any. Later migrations have higher ranks.</td>
</tr>
<tr>
<td>contexts.<em>.flywayBeans.</em>.migrations[].script</td>
<td>String</td>
<td>Name of the script used to execute the migration, if any.</td>
</tr>
<tr>
<td>contexts.<em>.flywayBeans.</em>.migrations[].state</td>
<td>String</td>
<td>State of the migration. (PENDING, ABOVE_TARGET, BELOW_BASELINE, BASELINE, IGNORED, MISSING_SUCCESS, MISSING_FAILED, SUCCESS, UNDONE, AVAILABLE, FAILED, OUT_OF_ORDER, FUTURE_SUCCESS, FUTURE_FAILED, OUTDATED, SUPERSEDED, DELETED)</td>
</tr>
<tr>
<td>contexts.<em>.flywayBeans.</em>.migrations[].type</td>
<td>String</td>
<td>Type of the migration. (SCHEMA, BASELINE, DELETE, SQL, UNDO_SQL, JDBC, UNDO_JDBC, SPRING_JDBC, UNDO_SPRING_JDBC, CUSTOM, UNDO_CUSTOM)</td>
</tr>
<tr>
<td>contexts.<em>.flywayBeans.</em>.migrations[].version</td>
<td>String</td>
<td>Version of the database after applying the migration, if any.</td>
</tr>
<tr>
<td>contexts.*.parentId</td>
<td>String</td>
<td>Id of the parent application context, if any.</td>
</tr>
</tbody>
</table>
Chapter 9. Health (health)

The health endpoint provides detailed information about the health of the application.

9.1. Retrieving the Health of the application

To retrieve the health of the application, make a GET request to /actuator/health, as shown in the following curl-based example:

```
$ curl 'http://localhost:8080/actuator/health' -i -X GET \
   -H 'Accept: application/json'
```

The resulting response is similar to the following:
HTTP/1.1 200 OK
Content-Type: application/json
Content-Length: 704

{
    "status": "UP",
    "components": {
        "broker": {
            "status": "UP",
            "components": {
                "us1": {
                    "status": "UP",
                    "details": {
                        "version": "1.0.2"
                    }
                },
                "us2": {
                    "status": "UP",
                    "details": {
                        "version": "1.0.4"
                    }
                }
            }
        },
        "db": {
            "status": "UP",
            "details": {
                "database": "H2",
                "validationQuery": "isValid()"
            }
        },
        "diskSpace": {
            "status": "UP",
            "details": {
                "total": 325496897536,
                "free": 270662610944,
                "threshold": 10485760,
                "exists": true
            }
        }
    }
}

9.1.1. Response Structure

The response contains details of the health of the application. The following table describes the structure of the response:
### 9.2. Retrieving the Health of a component

To retrieve the health of a particular component of the application’s health, make a **GET** request to `/actuator/health/{component}`, as shown in the following curl-based example:

```
$ curl 'http://localhost:8080/actuator/health/db' -i -X GET \\
-H 'Accept: application/json'
```

The resulting response is similar to the following:

```
HTTP/1.1 200 OK
Content-Type: application/json
Content-Length: 101

{
  "status" : "UP",
  "details" : {
    "database" : "H2",
    "validationQuery" : "isValid()"
  }
}
```

### 9.2.1. Response Structure

The response contains details of the health of a particular component of the application’s health. The following table describes the structure of the response:

<table>
<thead>
<tr>
<th>Path</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>status</td>
<td>String</td>
<td>Overall status of the application.</td>
</tr>
<tr>
<td>components</td>
<td>Object</td>
<td>The components that make up the health.</td>
</tr>
<tr>
<td>components.*.status</td>
<td>String</td>
<td>Status of a specific part of the application.</td>
</tr>
<tr>
<td>components.*.components</td>
<td>Object</td>
<td>The nested components that make up the health.</td>
</tr>
<tr>
<td>components.*.details</td>
<td>Object</td>
<td>Details of the health of a specific part of the application. Presence is controlled by <code>management.endpoint.health.show-details</code>.</td>
</tr>
</tbody>
</table>
9.3. Retrieving the Health of a nested component

If a particular component contains other nested components (as the broker indicator in the example above), the health of such a nested component can be retrieved by issuing a GET request to /actuator/health/{component}/{subcomponent}, as shown in the following curl-based example:

```bash
$ curl 'http://localhost:8080/actuator/health/broker/us1' -i -X GET \
-H 'Accept: application/json'
```

The resulting response is similar to the following:

```
HTTP/1.1 200 OK
Content-Type: application/json
Content-Length: 66

{
   "status" : "UP",
   "details" : {
      "version" : "1.0.2"
   }
}
```

Components of an application’s health may be nested arbitrarily deep depending on the application’s health indicators and how they have been grouped. The health endpoint supports any number of /{component} identifiers in the URL to allow the health of a component at any depth to be retrieved.

9.3.1. Response Structure

The response contains details of the health of an instance of a particular component of the application. The following table describes the structure of the response:

<table>
<thead>
<tr>
<th>Path</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>status</td>
<td>String</td>
<td>Status of a specific part of the application</td>
</tr>
<tr>
<td>details</td>
<td>Object</td>
<td>Details of the health of a specific part of the application.</td>
</tr>
</tbody>
</table>
Chapter 10. Heap Dump (heapdump)

The heapdump endpoint provides a heap dump from the application’s JVM.

10.1. Retrieving the Heap Dump

To retrieve the heap dump, make a GET request to /actuator/heapdump. The response is binary data in HPROF format and can be large. Typically, you should save the response to disk for subsequent analysis. When using curl, this can be achieved by using the -O option, as shown in the following example:

```
$ curl 'http://localhost:8080/actuator/heapdump' -O
```

The preceding example results in a file named heapdump being written to the current working directory.
Chapter 11. HTTP Trace (httptrace)

The httptrace endpoint provides information about HTTP request-response exchanges.

11.1. Retrieving the Traces

To retrieve the traces, make a GET request to /actuator/httptrace, as shown in the following curl-based example:

```bash
$ curl 'http://localhost:8080/actuator/httptrace' -i -X GET
```

The resulting response is similar to the following:

```
HTTP/1.1 200 OK
Content-Type: application/vnd.spring-boot.actuator.v3+json
Content-Length: 503

{
   "traces": [
      {
         "timestamp": "2021-06-10T07:26:39.762Z",
         "principal": {
            "name": "alice"
         },
         "session": {
            "id": "db2c3cf0-5b49-4d77-8ec9-eef96647a0aa"
         },
         "request": {
            "method": "GET",
            "uri": "https://api.example.com",
            "headers": {
               "Accept": [ "application/json" ]
            }
         },
         "response": {
            "status": 200,
            "headers": {
               "Content-Type": [ "application/json" ]
            }
         }
      }
   ],
   "timeTaken": 0
}
```

11.1.1. Response Structure

The response contains details of the traced HTTP request-response exchanges. The following table describes the structure of the response:
<table>
<thead>
<tr>
<th>Path</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>traces</td>
<td>Array</td>
<td>An array of traced HTTP request-response exchanges.</td>
</tr>
<tr>
<td>traces[].timestamp</td>
<td>String</td>
<td>Timestamp of when the traced exchange occurred.</td>
</tr>
<tr>
<td>traces[].principal</td>
<td>Object</td>
<td>Principal of the exchange, if any.</td>
</tr>
<tr>
<td>traces[].principal.name</td>
<td>String</td>
<td>Name of the principal.</td>
</tr>
<tr>
<td>traces[].request.method</td>
<td>String</td>
<td>HTTP method of the request.</td>
</tr>
<tr>
<td>traces[].request.remoteAddress</td>
<td>String</td>
<td>Remote address from which the request was received, if known.</td>
</tr>
<tr>
<td>traces[].request.uri</td>
<td>String</td>
<td>URI of the request.</td>
</tr>
<tr>
<td>traces[].request.headers</td>
<td>Object</td>
<td>Headers of the request, keyed by header name.</td>
</tr>
<tr>
<td>traces[].request.headers.*[].</td>
<td>Array</td>
<td>Values of the header</td>
</tr>
<tr>
<td>traces[].response.status</td>
<td>Number</td>
<td>Status of the response</td>
</tr>
<tr>
<td>traces[].response.headers</td>
<td>Object</td>
<td>Headers of the response, keyed by header name.</td>
</tr>
<tr>
<td>traces[].response.headers.*[].</td>
<td>Array</td>
<td>Values of the header</td>
</tr>
<tr>
<td>traces[].session</td>
<td>Object</td>
<td>Session associated with the exchange, if any.</td>
</tr>
<tr>
<td>traces[].session.id</td>
<td>String</td>
<td>ID of the session.</td>
</tr>
<tr>
<td>traces[].timeTaken</td>
<td>Number</td>
<td>Time, in milliseconds, taken to handle the exchange.</td>
</tr>
</tbody>
</table>
Chapter 12. Info (info)

The info endpoint provides general information about the application.

12.1. Retrieving the Info

To retrieve the information about the application, make a GET request to /actuator/info, as shown in the following curl-based example:

```
$ curl 'http://localhost:8080/actuator/info' -i -X GET
```

The resulting response is similar to the following:

```
HTTP/1.1 200 OK
Content-Type: application/vnd.spring-boot.actuator.v3+json
Content-Length: 233

{
    "git": {
        "commit": {
            "time": "+53410-08-24T23:59:18Z",
            "id": "df027cf"
        },
        "branch": "main"
    },
    "build": {
        "version": "1.0.3",
        "artifact": "application",
        "group": "com.example"
    }
}
```

12.1.1. Response Structure

The response contains general information about the application. Each section of the response is contributed by an InfoContributor. Spring Boot provides build and git contributions.

Build Response Structure

The following table describe the structure of the build section of the response:

<table>
<thead>
<tr>
<th>Path</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>artifact</td>
<td>String</td>
<td>Artifact ID of the application, if any.</td>
</tr>
<tr>
<td>group</td>
<td>String</td>
<td>Group ID of the application, if any.</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the application, if any.</td>
</tr>
</tbody>
</table>
### Git Response Structure

The following table describes the structure of the `git` section of the response:

<table>
<thead>
<tr>
<th>Path</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>branch</td>
<td>String</td>
<td>Name of the Git branch, if any.</td>
</tr>
<tr>
<td>commit</td>
<td>Object</td>
<td>Details of the Git commit, if any.</td>
</tr>
<tr>
<td>commit.time</td>
<td>Varies</td>
<td>Timestamp of the commit, if any.</td>
</tr>
<tr>
<td>commit.id</td>
<td>String</td>
<td>ID of the commit, if any.</td>
</tr>
</tbody>
</table>
Chapter 13. Spring Integration graph

(integrationgraph)

The integrationgraph endpoint exposes a graph containing all Spring Integration components.

13.1. Retrieving the Spring Integration graph

To retrieve the information about the application, make a GET request to /actuator/integrationgraph, as shown in the following curl-based example:

```
$ curl 'http://localhost:8080/actuator/integrationgraph' -i -X GET
```

The resulting response is similar to the following:
HTTP/1.1 200 OK
Content-Type: application/vnd.spring-boot.actuator.v3+json
Content-Length: 961

{
  "contentDescriptor": {
    "providerVersion": "5.4.7",
    "providerFormatVersion": 1.2,
    "provider": "spring-integration"
  },
  "nodes": [
    {
      "nodeId": 1,
      "componentType": "null-channel",
      "integrationPatternType": "null_channel",
      "integrationPatternCategory": "messaging_channel",
      "properties": {},
      "name": "nullChannel"
    },
    {
      "nodeId": 2,
      "componentType": "publish-subscribe-channel",
      "integrationPatternType": "publish_subscribe_channel",
      "integrationPatternCategory": "messaging_channel",
      "properties": {},
      "name": "errorChannel"
    },
    {
      "nodeId": 3,
      "componentType": "logging-channel-adapter",
      "integrationPatternType": "outbound_channel_adapter",
      "integrationPatternCategory": "messaging_endpoint",
      "properties": {},
      "input": "errorChannel",
      "name": "errorLogger"
    }
  ],
  "links": [
    {
      "from": 2,
      "to": 3,
      "type": "input"
    }
  ]
}

13.1.1. Response Structure

The response contains all Spring Integration components used within the application, as well as the links between them. More information about the structure can be found in the reference documentation.
13.2. Rebuilding the Spring Integration graph

To rebuild the exposed graph, make a POST request to /actuator/integrationgraph, as shown in the following curl-based example:

$ curl 'http://localhost:8080/actuator/integrationgraph' -i -X POST

This will result in a 204 - No Content response:

HTTP/1.1 204 No Content
Chapter 14. Liquibase (liquibase)

The liquibase endpoint provides information about database change sets applied by Liquibase.

14.1. Retrieving the Changes

To retrieve the changes, make a GET request to /actuator/liquibase, as shown in the following curl-based example:

```
$ curl 'http://localhost:8080/actuator/liquibase' -i -X GET
```

The resulting response is similar to the following:

```
HTTP/1.1 200 OK
Content-Type: application/vnd.spring-boot.actuator.v3+json
Content-Length: 688

{
  "contexts": {
    "application": {
      "liquibaseBeans": {
        "liquibase": {
          "changeSets": [
            {
              "author": "marceloverdijk",
              "changeLog": "classpath:/db/changelog/db.changelog-master.yaml",
              "comments": "",
              "contexts": [],
              "dateExecuted": "2021-06-10T07:26:33.017Z",
              "deploymentId": "3309992976",
              "description": "createTable tableName=customer",
              "execType": "EXECUTED",
              "id": "1",
              "labels": [],
              "checksum": "8:46debf252cce6d7b25e28ddeb9fc4bf6",
              "orderExecuted": 1
            }
          ]
        }
      }
    }
  }
}
```

14.1.1. Response Structure

The response contains details of the application’s Liquibase change sets. The following table describes the structure of the response:
<table>
<thead>
<tr>
<th>Path</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>contexts</td>
<td>Object</td>
<td>Application contexts keyed by id</td>
</tr>
<tr>
<td>contexts.<em>.liquibaseBeans.</em>.changeSets</td>
<td>Array</td>
<td>Change sets made by the Liquibase beans, keyed by bean name.</td>
</tr>
<tr>
<td>contexts.<em>.liquibaseBeans.</em>.changeSets[].author</td>
<td>String</td>
<td>Author of the change set.</td>
</tr>
<tr>
<td>contexts.<em>.liquibaseBeans.</em>.changeSets[].changeLog</td>
<td>String</td>
<td>Change log that contains the change set.</td>
</tr>
<tr>
<td>contexts.<em>.liquibaseBeans.</em>.changeSets[].comments</td>
<td>String</td>
<td>Comments on the change set.</td>
</tr>
<tr>
<td>contexts.<em>.liquibaseBeans.</em>.changeSets[].contexts</td>
<td>Array</td>
<td>Contexts of the change set.</td>
</tr>
<tr>
<td>contexts.<em>.liquibaseBeans.</em>.changeSets[].dateExecuted</td>
<td>String</td>
<td>Timestamp of when the change set was executed.</td>
</tr>
<tr>
<td>contexts.<em>.liquibaseBeans.</em>.changeSets[].deploymentId</td>
<td>String</td>
<td>ID of the deployment that ran the change set.</td>
</tr>
<tr>
<td>contexts.<em>.liquibaseBeans.</em>.changeSets[].description</td>
<td>String</td>
<td>Description of the change set.</td>
</tr>
<tr>
<td>contexts.<em>.liquibaseBeans.</em>.changeSets[].execType</td>
<td>String</td>
<td>Execution type of the change set (EXECUTED, FAILED, SKIPPED, RERAN, MARK_RAN)</td>
</tr>
<tr>
<td>contexts.<em>.liquibaseBeans.</em>.changeSets[].id</td>
<td>String</td>
<td>ID of the change set.</td>
</tr>
<tr>
<td>contexts.<em>.liquibaseBeans.</em>.changeSets[].labels</td>
<td>Array</td>
<td>Labels associated with the change set.</td>
</tr>
<tr>
<td>contexts.<em>.liquibaseBeans.</em>.changeSets[].checksum</td>
<td>String</td>
<td>Checksum of the change set.</td>
</tr>
<tr>
<td>contexts.<em>.liquibaseBeans.</em>.changeSets[].orderExecuted</td>
<td>Number</td>
<td>Order of the execution of the change set.</td>
</tr>
<tr>
<td>contexts.<em>.liquibaseBeans.</em>.changeSets[].tag</td>
<td>String</td>
<td>Tag associated with the change set, if any.</td>
</tr>
<tr>
<td>contexts.*.parentId</td>
<td>String</td>
<td>Id of the parent application context, if any.</td>
</tr>
</tbody>
</table>
Chapter 15. Log File (logfile)

The logfile endpoint provides access to the contents of the application’s log file.

15.1. Retrieving the Log File

To retrieve the log file, make a GET request to /actuator/logfile, as shown in the following curl-based example:

```bash
$ curl 'http://localhost:8080/actuator/logfile' -i -X GET
```

The resulting response is similar to the following:

```
HTTP/1.1 200 OK
Accept-Ranges: bytes
Content-Type: text/plain;charset=UTF-8
Content-Length: 4723

2017-08-08 17:12:30.910  INFO 19866 --- [           main]

15.2. Retrieving Part of the Log File

Retrieving part of the log file is not supported when using Jersey.

To retrieve part of the log file, make a GET request to `/actuator/logfile` by using the `Range` header, as shown in the following curl-based example:

```
$ curl 'http://localhost:8080/actuator/logfile' -i -X GET -H 'Range: bytes=0-1023'
```

The preceding example retrieves the first 1024 bytes of the log file. The resulting response is similar to the following:

```
HTTP/1.1 206 Partial Content
Accept-Ranges: bytes
Content-Type: text/plain;charset=UTF-8
Content-Range: bytes 0-1023/4723
Content-Length: 1024

Chapter 16. Loggers (loggers)

The loggers endpoint provides access to the application’s loggers and the configuration of their levels.

16.1. Retrieving All Loggers

To retrieve the application’s loggers, make a GET request to /actuator/loggers, as shown in the following curl-based example:

```bash
$ curl 'http://localhost:8080/actuator/loggers' -i -X GET
```

The resulting response is similar to the following:

```json
HTTP/1.1 200 OK
Content-Type: application/vnd.spring-boot.actuator.v3+json
Content-Length: 791

{
  "levels": [ "OFF", "FATAL", "ERROR", "WARN", "INFO", "DEBUG", "TRACE" ],
  "loggers": {
    "ROOT": {
      "configuredLevel": "INFO",
      "effectiveLevel": "INFO"
    },
    "com.example": {
      "configuredLevel": "DEBUG",
      "effectiveLevel": "DEBUG"
    }
  },
  "groups": {
    "test": {
      "configuredLevel": "INFO",
      "members": [ "test.member1", "test.member2" ]
    },
    "web": {
      "members": [ "org.springframework.core.codec", "org.springframework.http",
                   "org.springframework.web", "org.springframework.boot.actuate.endpoint.web",
                   "org.springframework.boot.web.servlet.ServletContextInitializerBeans" ]
    },
    "sql": {
      "members": [ "org.springframework.jdbc.core", "org.hibernate.SQL",
                   "org.jooq.tools.LoggerListener" ]
    }
  }
}
```
16.1.1. Response Structure

The response contains details of the application’s loggers. The following table describes the structure of the response:

<table>
<thead>
<tr>
<th>Path</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>levels</td>
<td>Array</td>
<td>Levels support by the logging system.</td>
</tr>
<tr>
<td>loggers</td>
<td>Object</td>
<td>Loggers keyed by name.</td>
</tr>
<tr>
<td>groups</td>
<td>Object</td>
<td>Logger groups keyed by name</td>
</tr>
<tr>
<td>loggers.*.configuredLevel</td>
<td>String</td>
<td>Configured level of the logger, if any.</td>
</tr>
<tr>
<td>loggers.*.effectiveLevel</td>
<td>String</td>
<td>Effective level of the logger.</td>
</tr>
<tr>
<td>groups.*.configuredLevel</td>
<td>String</td>
<td>Configured level of the logger group, if any.</td>
</tr>
<tr>
<td>groups.*.members</td>
<td>Array</td>
<td>Loggers that are part of this group</td>
</tr>
</tbody>
</table>

16.2. Retrieving a Single Logger

To retrieve a single logger, make a GET request to /actuator/loggers/{logger.name}, as shown in the following curl-based example:

```
$ curl 'http://localhost:8080/actuator/loggers/com.example' -i -X GET
```

The preceding example retrieves information about the logger named com.example. The resulting response is similar to the following:

```
HTTP/1.1 200 OK
Content-Disposition: inline;filename=f.txt
Content-Type: application/vnd.spring-boot.actuator.v3+json
Content-Length: 61

{
   "configuredLevel" : "INFO",
   "effectiveLevel" : "INFO"
}
```

16.2.1. Response Structure

The response contains details of the requested logger. The following table describes the structure of the response:

<table>
<thead>
<tr>
<th>Path</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuredLevel</td>
<td>String</td>
<td>Configured level of the logger, if any.</td>
</tr>
</tbody>
</table>
### 16.3. Retrieving a Single Group

To retrieve a single group, make a **GET** request to `/actuator/loggers/{group.name}`, as shown in the following curl-based example:

```bash
$ curl 'http://localhost:8080/actuator/loggers/test' -i -X GET
```

The preceding example retrieves information about the logger group named `test`. The resulting response is similar to the following:

```
HTTP/1.1 200 OK
Content-Type: application/vnd.spring-boot.actuator.v3+json
Content-Length: 82

{
  "configuredLevel" : "INFO",
  "members" : [ "test.member1", "test.member2" ]
}
```

#### 16.3.1. Response Structure

The response contains details of the requested group. The following table describes the structure of the response:

<table>
<thead>
<tr>
<th>Path</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuredLevel</td>
<td>String</td>
<td>Configured level of the logger group, if any.</td>
</tr>
<tr>
<td>members</td>
<td>Array</td>
<td>Loggers that are part of this group</td>
</tr>
</tbody>
</table>

### 16.4. Setting a Log Level

To set the level of a logger, make a **POST** request to `/actuator/loggers/{logger.name}` with a JSON body that specifies the configured level for the logger, as shown in the following curl-based example:

```bash
$ curl 'http://localhost:8080/actuator/loggers/com.example' -i -X POST \
-H 'Content-Type: application/json' \
-d '{"configuredLevel":"debug"}'
```

The preceding example sets the `configuredLevel` of the `com.example` logger to `DEBUG`. 
16.4.1. Request Structure

The request specifies the desired level of the logger. The following table describes the structure of the request:

<table>
<thead>
<tr>
<th>Path</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuredLevel</td>
<td>String</td>
<td>Level for the logger. May be omitted to clear the level.</td>
</tr>
</tbody>
</table>

16.5. Setting a Log Level for a Group

To set the level of a logger, make a POST request to /actuator/loggers/{group.name} with a JSON body that specifies the configured level for the logger group, as shown in the following curl-based example:

```
$ curl 'http://localhost:8080/actuator/loggers/test' -i -X POST \
    -H 'Content-Type: application/json' \
    -d '{"configuredLevel":"debug"}"
```

The preceding example sets the configuredLevel of the test logger group to DEBUG.

16.5.1. Request Structure

The request specifies the desired level of the logger group. The following table describes the structure of the request:

<table>
<thead>
<tr>
<th>Path</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuredLevel</td>
<td>String</td>
<td>Level for the logger. May be omitted to clear the level.</td>
</tr>
</tbody>
</table>

16.6. Clearing a Log Level

To clear the level of a logger, make a POST request to /actuator/loggers/{logger.name} with a JSON body containing an empty object, as shown in the following curl-based example:

```
$ curl 'http://localhost:8080/actuator/loggers/com.example' -i -X POST \
    -H 'Content-Type: application/json' \
    -d '{}'
```

The preceding example clears the configured level of the com.example logger.
Chapter 17. Mappings (mappings)

The mappings endpoint provides information about the application's request mappings.

17.1. Retrieving the Mappings

To retrieve the mappings, make a GET request to /actuator/mappings, as shown in the following curl-based example:

```
$ curl 'http://localhost:32867/actuator/mappings' -i -X GET
```

The resulting response is similar to the following:

```
HTTP/1.1 200 OK
Content-Type: application/vnd.spring-boot.actuator.v3+json
Transfer-Encoding: chunked
Date: Thu, 10 Jun 2021 07:26:21 GMT
Content-Length: 5339

17.1.1. Response Structure

The response contains details of the application’s mappings. The items found in the response depend on the type of web application (reactive or Servlet-based). The following table describes the structure of the common elements of the response:

<table>
<thead>
<tr>
<th>Path</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>contexts</td>
<td>Object</td>
<td>Application contexts keyed by id.</td>
</tr>
<tr>
<td>contexts.*.mappings</td>
<td>Object</td>
<td>Mappings in the context, keyed by mapping type.</td>
</tr>
<tr>
<td>contexts.*.mappings.dispatcherServlets</td>
<td>Object</td>
<td>Dispatcher servlet mappings, if any.</td>
</tr>
<tr>
<td>contexts.*.mappings.servletFilters</td>
<td>Array</td>
<td>Servlet filter mappings, if any.</td>
</tr>
<tr>
<td>contexts.*.mappings.servlets</td>
<td>Array</td>
<td>Servlet mappings, if any.</td>
</tr>
<tr>
<td>contexts.*.mappings.dispatcherHandlers</td>
<td>Object</td>
<td>Dispatcher handler mappings, if any.</td>
</tr>
<tr>
<td>contexts.*.parentId</td>
<td>String</td>
<td>Id of the parent application context, if any.</td>
</tr>
</tbody>
</table>

The entries that may be found in `contexts.*.mappings` are described in the following sections.

17.1.2. Dispatcher Servlets Response Structure

When using Spring MVC, the response contains details of any DispatcherServlet request mappings beneath `contexts.*.mappings.dispatcherServlets`. The following table describes the structure of this section of the response:

<table>
<thead>
<tr>
<th>Path</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>Array</td>
<td>Dispatcher servlet mappings, if any, keyed by dispatcher servlet bean name.</td>
</tr>
<tr>
<td>Path</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>---------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>*.[].details</td>
<td>Object</td>
<td>Additional implementation-specific details about the mapping. Optional.</td>
</tr>
<tr>
<td>*.[].handler</td>
<td>String</td>
<td>Handler for the mapping.</td>
</tr>
<tr>
<td>*.[].predicate</td>
<td>String</td>
<td>Predicate for the mapping.</td>
</tr>
<tr>
<td>*.[].details.handlerMethod</td>
<td>Object</td>
<td>Details of the method, if any, that will handle requests to this mapping.</td>
</tr>
<tr>
<td>*.[].details.handlerMethod.className</td>
<td>Varies</td>
<td>Fully qualified name of the class of the method.</td>
</tr>
<tr>
<td>*.[].details.handlerMethod.name</td>
<td>Varies</td>
<td>Name of the method.</td>
</tr>
<tr>
<td>*.[].details.requestMappingConditions</td>
<td>Object</td>
<td>Details of the request mapping conditions.</td>
</tr>
<tr>
<td>*.[].details.requestMappingConditions.consumes</td>
<td>Varies</td>
<td>Details of the consumes condition</td>
</tr>
<tr>
<td>*.[].details.requestMappingConditions.consumes.[].mediaType</td>
<td>Varies</td>
<td>Consumed media type.</td>
</tr>
<tr>
<td>*.[].details.requestMappingConditions.consumes.[].negated</td>
<td>Varies</td>
<td>Whether the media type is negated.</td>
</tr>
<tr>
<td>*.[].details.requestMappingConditions.headers</td>
<td>Varies</td>
<td>Details of the headers condition.</td>
</tr>
<tr>
<td>*.[].details.requestMappingConditions.headers.[].name</td>
<td>Varies</td>
<td>Name of the header.</td>
</tr>
<tr>
<td>*.[].details.requestMappingConditions.headers.[].value</td>
<td>Varies</td>
<td>Required value of the header, if any.</td>
</tr>
<tr>
<td>*.[].details.requestMappingConditions.headers.[].negated</td>
<td>Varies</td>
<td>Whether the value is negated.</td>
</tr>
<tr>
<td>*.[].details.requestMappingConditions.methods</td>
<td>Varies</td>
<td>HTTP methods that are handled.</td>
</tr>
<tr>
<td>*.[].details.requestMappingConditions.params</td>
<td>Varies</td>
<td>Details of the params condition.</td>
</tr>
<tr>
<td>*.[].details.requestMappingConditions.params.[].name</td>

<td>Whether the value is negated.</td>
</tr>
<tr>
<td>Path</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------------------------------------</td>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>*.[].details.requestMappingConditions.patterns</td>
<td>Varies</td>
<td>Patterns identifying the paths handled by the mapping.</td>
</tr>
<tr>
<td>*.[].details.requestMappingConditions.produces</td>
<td>Varies</td>
<td>Details of the produces condition.</td>
</tr>
<tr>
<td>*.[].details.requestMappingConditions.produces.[].mediaType</td>
<td>Varies</td>
<td>Produced media type.</td>
</tr>
<tr>
<td>*.[].details.requestMappingConditions.produces.[].negated</td>
<td>Varies</td>
<td>Whether the media type is negated.</td>
</tr>
</tbody>
</table>

### 17.1.3. Servlets Response Structure

When using the Servlet stack, the response contains details of any Servlet mappings beneath contexts.*.mappings.servlets. The following table describes the structure of this section of the response:

<table>
<thead>
<tr>
<th>Path</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[]_mappings</td>
<td>Array</td>
<td>Mappings of the servlet.</td>
</tr>
<tr>
<td>[]_name</td>
<td>String</td>
<td>Name of the servlet.</td>
</tr>
<tr>
<td>[]_className</td>
<td>String</td>
<td>Class name of the servlet.</td>
</tr>
</tbody>
</table>

### 17.1.4. Servlet Filters Response Structure

When using the Servlet stack, the response contains details of any Filter mappings beneath contexts.*.mappings.servletFilters. The following table describes the structure of this section of the response:

<table>
<thead>
<tr>
<th>Path</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[]_servletNameMappings</td>
<td>Array</td>
<td>Names of the servlets to which the filter is mapped.</td>
</tr>
<tr>
<td>[]_urlPatternMappings</td>
<td>Array</td>
<td>URL pattern to which the filter is mapped.</td>
</tr>
<tr>
<td>[]_name</td>
<td>String</td>
<td>Name of the filter.</td>
</tr>
<tr>
<td>[]_className</td>
<td>String</td>
<td>Class name of the filter.</td>
</tr>
</tbody>
</table>

### 17.1.5. Dispatcher Handlers Response Structure

When using Spring WebFlux, the response contains details of any DispatcherHandler request mappings beneath contexts.*.mappings.dispatcherHandlers. The following table describes the structure of this section of the response:
<table>
<thead>
<tr>
<th>Path</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>Array</td>
<td>Dispatcher handler mappings, if any, keyed by dispatcher handler bean name.</td>
</tr>
<tr>
<td>*.[].details</td>
<td>Object</td>
<td>Additional implementation-specific details about the mapping. Optional.</td>
</tr>
<tr>
<td>*.[].handler</td>
<td>String</td>
<td>Handler for the mapping.</td>
</tr>
<tr>
<td>*.[].predicate</td>
<td>String</td>
<td>Predicate for the mapping.</td>
</tr>
<tr>
<td>*.[].details.requestMappingConditions</td>
<td>Object</td>
<td>Details of the request mapping conditions.</td>
</tr>
<tr>
<td>*.[].details.requestMappingConditions.consumes</td>
<td>Array</td>
<td>Details of the consumes condition</td>
</tr>
<tr>
<td>*.[].details.requestMappingConditions.consumes.[].mediaType</td>
<td>String</td>
<td>Consumed media type.</td>
</tr>
<tr>
<td>*.[].details.requestMappingConditions.consumes.[].negated</td>
<td>Boolean</td>
<td>Whether the media type is negated.</td>
</tr>
<tr>
<td>*.[].details.requestMappingConditions.headers</td>
<td>Array</td>
<td>Details of the headers condition.</td>
</tr>
<tr>
<td>*.[].details.requestMappingConditions.headers.[].name</td>
<td>String</td>
<td>Name of the header.</td>
</tr>
<tr>
<td>*.[].details.requestMappingConditions.headers.[].value</td>
<td>String</td>
<td>Required value of the header, if any.</td>
</tr>
<tr>
<td>*.[].details.requestMappingConditions.headers.[].negated</td>
<td>Boolean</td>
<td>Whether the value is negated.</td>
</tr>
<tr>
<td>*.[].details.requestMappingConditions.methods</td>
<td>Array</td>
<td>HTTP methods that are handled.</td>
</tr>
<tr>
<td>*.[].details.requestMappingConditions.params</td>
<td>Array</td>
<td>Details of the params condition.</td>
</tr>
<tr>
<td>*.[].details.requestMappingConditions.params.[].name</td>
<td>String</td>
<td>Name of the parameter.</td>
</tr>
<tr>
<td>*.[].details.requestMappingConditions.params.[].value</td>
<td>String</td>
<td>Required value of the parameter, if any.</td>
</tr>
<tr>
<td>*.[].details.requestMappingConditions.params.[].negated</td>
<td>Boolean</td>
<td>Whether the value is negated.</td>
</tr>
<tr>
<td>*.[].details.requestMappingConditions.patterns</td>
<td>Array</td>
<td>Patterns identifying the paths handled by the mapping.</td>
</tr>
<tr>
<td>*.[].details.requestMappingConditions.produces</td>
<td>Array</td>
<td>Details of the produces condition.</td>
</tr>
<tr>
<td>Path</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------------------------------------</td>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>*[].details.requestMappingConditions.produces[].mediaType</td>
<td>String</td>
<td>Produced media type.</td>
</tr>
<tr>
<td>*[].details.requestMappingConditions.produces[].negated</td>
<td>Boolean</td>
<td>Whether the media type is negated.</td>
</tr>
<tr>
<td>*[].details.handlerMethod</td>
<td>Object</td>
<td>Details of the method, if any, that will handle requests to this mapping.</td>
</tr>
<tr>
<td>*[].details.handlerMethod.className</td>
<td>String</td>
<td>Fully qualified name of the class of the method.</td>
</tr>
<tr>
<td>*[].details.handlerMethod.name</td>
<td>String</td>
<td>Name of the method.</td>
</tr>
<tr>
<td>*[].details.handlerFunction</td>
<td>Object</td>
<td>Details of the function, if any, that will handle requests to this mapping.</td>
</tr>
<tr>
<td>*[].details.handlerFunction.className</td>
<td>String</td>
<td>Fully qualified name of the class of the function.</td>
</tr>
</tbody>
</table>
Chapter 18. Metrics (metrics)

The `metrics` endpoint provides access to application metrics.

18.1. Retrieving Metric Names

To retrieve the names of the available metrics, make a `GET` request to `/actuator/metrics`, as shown in the following curl-based example:

```
$ curl 'http://localhost:8080/actuator/metrics' -i -X GET
```

The resulting response is similar to the following:

```
HTTP/1.1 200 OK
Content-Type: application/vnd.spring-boot.actuator.v3+json
Content-Length: 154

{
   "names" : [ "jvm.buffer.count", "jvm.buffer.memory.used",
               "jvm.buffer.total.capacity", "jvm.memory.committed", "jvm.memory.max",
               "jvm.memory.used" ]
}
```

18.1.1. Response Structure

The response contains details of the metric names. The following table describes the structure of the response:

<table>
<thead>
<tr>
<th>Path</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>names</td>
<td>Array</td>
<td>Names of the known metrics.</td>
</tr>
</tbody>
</table>

18.2. Retrieving a Metric

To retrieve a metric, make a `GET` request to `/actuator/metrics/{metric.name}`, as shown in the following curl-based example:

```
$ curl 'http://localhost:8080/actuator/metrics/jvm.memory.max' -i -X GET
```

The preceding example retrieves information about the metric named `jvm.memory.max`. The resulting response is similar to the following:
HTTP/1.1 200 OK
Content-Disposition: inline;filename=f.txt
Content-Type: application/vnd.spring-boot.actuator.v3+json
Content-Length: 474

```json
{
    "name": "jvm.memory.max",
    "description": "The maximum amount of memory in bytes that can be used for memory management",
    "baseUnit": "bytes",
    "measurements": [
        {
            "statistic": "VALUE",
            "value": 2.380267519E9
        }
    ],
    "availableTags": [
        {
            "tag": "area",
            "values": ["heap", "nonheap"]
        },
        {
            "tag": "id",
            "values": ["Compressed Class Space", "PS Old Gen", "PS Survivor Space", "Metaspace", "PS Eden Space", "Code Cache"]
        }
    ]
}
```

### 18.2.1. Query Parameters

The endpoint uses query parameters to drill down into a metric by using its tags. The following table shows the single supported query parameter:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>A tag to use for drill-down in the form name:value.</td>
</tr>
</tbody>
</table>

### 18.2.2. Response structure

The response contains details of the metric. The following table describes the structure of the response:

<table>
<thead>
<tr>
<th>Path</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the metric</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>Description of the metric</td>
</tr>
<tr>
<td>baseUnit</td>
<td>String</td>
<td>Base unit of the metric</td>
</tr>
<tr>
<td>measurements</td>
<td>Array</td>
<td>Measurements of the metric</td>
</tr>
</tbody>
</table>
### 18.3. Drilling Down

To drill down into a metric, make a GET request to `/actuator/metrics/{metric.name}` using the tag query parameter, as shown in the following curl-based example:

```bash
$ curl 'http://localhost:8080/actuator/metrics/jvm.memory.max?tag=area%3Anonheap&tag=id%3ACompressed+Class+Space' -i -X GET
```

The preceding example retrieves the `jvm.memory.max` metric, where the `area` tag has a value of `nonheap` and the `id` attribute has a value of `Compressed Class Space`. The resulting response is similar to the following:

```
HTTP/1.1 200 OK
Content-Disposition: inline;filename=f.txt
Content-Type: application/vnd.spring-boot.actuator.v3+json
Content-Length: 263

{
    "name" : "jvm.memory.max",
    "description" : "The maximum amount of memory in bytes that can be used for memory management",
    "baseUnit" : "bytes",
    "measurements" : [ {
        "statistic" : "VALUE",
        "value" : 1.073741824E9
    } ],
    "availableTags" : [ ]
}
```
Chapter 19. Prometheus (prometheus)

The prometheus endpoint provides Spring Boot application’s metrics in the format required for scraping by a Prometheus server.

19.1. Retrieving All Metrics

To retrieve all metrics, make a GET request to /actuator/prometheus, as shown in the following curl-based example:

```bash
$ curl 'http://localhost:8080/actuator/prometheus' -i -X GET
```

The resulting response is similar to the following:
HTTP/1.1 200 OK
Content-Type: text/plain;version=0.0.4;charset=utf-8
Content-Length: 2373

# HELP jvm_memory_committed_bytes The amount of memory in bytes that is committed for

jvm_buffer_total_capacity_bytes{id="mapped"}, 0.0

19.1.1. Query Parameters

The endpoint uses query parameters to limit the samples that it returns. The following table shows
the supported query parameters:
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>includedNames</td>
<td>Restricts the samples to those that match the names. Optional.</td>
</tr>
</tbody>
</table>

## 19.2. Retrieving Filtered Metrics

To retrieve metrics matching specific names, make a **GET** request to `/actuator/prometheus` with the **includedNames** query parameter, as shown in the following curl-based example:

```
$ curl 'http://localhost:8080/actuator/prometheus?includedNames=jvm_memory_used_bytes%2Cjvm_memory_committed_bytes' -i -X GET
```

The resulting response is similar to the following:

```
HTTP/1.1 200 OK
Content-Type: text/plain;version=0.0.4;charset=utf-8
Content-Length: 1111

# HELP jvm_memory_committed_bytes The amount of memory in bytes that is committed for the Java virtual machine to use
# TYPE jvm_memory_committed_bytes gauge
jvm_memory_committed_bytes{area="heap",id="PS Survivor Space"} 4.5613056E7
jvm_memory_committed_bytes{area="heap",id="PS Old Gen"} 5.35822336E8
jvm_memory_committed_bytes{area="heap",id="PS Eden Space"} 2.56376832E8
jvm_memory_committed_bytes{area="nonheap",id="Metaspace"} 1.5859712E8
jvm_memory_committed_bytes{area="nonheap",id="Code Cache"} 5.181312E7
jvm_memory_committed_bytes{area="nonheap",id="Compressed Class Space"} 2.3855104E7

# HELP jvm_memory_used_bytes The amount of used memory
# TYPE jvm_memory_used_bytes gauge
jvm_memory_used_bytes{area="heap",id="PS Survivor Space"} 2.2127336E7
jvm_memory_used_bytes{area="heap",id="PS Old Gen"} 1.34452216E8
jvm_memory_used_bytes{area="heap",id="PS Eden Space"} 1.56612784E8
jvm_memory_used_bytes{area="nonheap",id="Metaspace"} 1.4333264E8
jvm_memory_used_bytes{area="nonheap",id="Code Cache"} 5.3978432E7
jvm_memory_used_bytes{area="nonheap",id="Compressed Class Space"} 2.0927104E7
```
Chapter 20. Scheduled Tasks (scheduledtasks)

The scheduledtasks endpoint provides information about the application’s scheduled tasks.

20.1. Retrieving the Scheduled Tasks

To retrieve the scheduled tasks, make a GET request to /actuator/scheduledtasks, as shown in the following curl-based example:

```
$ curl 'http://localhost:8080/actuator/scheduledtasks' -i -X GET
```

The resulting response is similar to the following:

```
HTTP/1.1 200 OK
Content-Type: application/vnd.spring-boot.actuator.v3+json
Content-Length: 629

{
  "cron" : [ {
    "runnable" : {
      "target" : "com.example.Processor.processOrders"
    },
    "expression" : "0 0 0/3 1/1 * ?"
  } ],
  "fixedDelay" : [ {
    "runnable" : {
      "target" : "com.example.Processor.purge"
    },
    "initialDelay" : 5000,
    "interval" : 5000
  } ],
  "fixedRate" : [ {
    "runnable" : {
      "target" : "com.example.Processor.retrieveIssues"
    },
    "initialDelay" : 10000,
    "interval" : 3000
  } ],
  "custom" : [ {
    "runnable" : {
      "target" : "com.example.Processor$CustomTriggeredRunnable"
    },
    "trigger" : "com.example.Processor$CustomTrigger@2f82e3f9"
  } ]
}
```
## 20.1.1. Response Structure

The response contains details of the application’s scheduled tasks. The following table describes the structure of the response:

<table>
<thead>
<tr>
<th>Path</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cron</td>
<td>Array</td>
<td>Cron tasks, if any.</td>
</tr>
<tr>
<td>cron[].runnable.target</td>
<td>String</td>
<td>Target that will be executed.</td>
</tr>
<tr>
<td>cron[].expression</td>
<td>String</td>
<td>Cron expression.</td>
</tr>
<tr>
<td>fixedDelay</td>
<td>Array</td>
<td>Fixed delay tasks, if any.</td>
</tr>
<tr>
<td>fixedDelay[].runnable.target</td>
<td>String</td>
<td>Target that will be executed.</td>
</tr>
<tr>
<td>fixedDelay[].initialDelay</td>
<td>Number</td>
<td>Delay, in milliseconds, before first execution.</td>
</tr>
<tr>
<td>fixedDelay[].interval</td>
<td>Number</td>
<td>Interval, in milliseconds, between the end of the last execution and the start of the next.</td>
</tr>
<tr>
<td>fixedRate</td>
<td>Array</td>
<td>Fixed rate tasks, if any.</td>
</tr>
<tr>
<td>fixedRate[].runnable.target</td>
<td>String</td>
<td>Target that will be executed.</td>
</tr>
<tr>
<td>fixedRate[].interval</td>
<td>Number</td>
<td>Interval, in milliseconds, between the start of each execution.</td>
</tr>
<tr>
<td>fixedRate[].initialDelay</td>
<td>Number</td>
<td>Delay, in milliseconds, before first execution.</td>
</tr>
<tr>
<td>custom</td>
<td>Array</td>
<td>Tasks with custom triggers, if any.</td>
</tr>
<tr>
<td>custom[].runnable.target</td>
<td>String</td>
<td>Target that will be executed.</td>
</tr>
<tr>
<td>custom[].trigger</td>
<td>String</td>
<td>Trigger for the task.</td>
</tr>
</tbody>
</table>
Chapter 21. Sessions (sessions)

The sessions endpoint provides information about the application’s HTTP sessions that are managed by Spring Session.

21.1. Retrieving Sessions

To retrieve the sessions, make a GET request to /actuator/sessions, as shown in the following curl-based example:

```bash
$ curl 'http://localhost:8080/actuator/sessions?username=alice' -i -X GET
```

The preceding examples retrieves all of the sessions for the user whose username is alice. The resulting response is similar to the following:

```
HTTP/1.1 200 OK
Content-Type: application/vnd.spring-boot.actuator.v3+json
Content-Length: 753

{
  "sessions" : [ {
    "id" : "4db5efcc-99cb-4d05-a52c-b49acfb7ea9",
    "attributeNames" : [ ],
    "creationTime" : "2021-06-10T02:26:18.226Z",
    "lastAccessedTime" : "2021-06-10T07:25:41.226Z",
    "maxInactiveInterval" : 1800,
    "expired" : false
  }, {
    "id" : "bd4c64f5-2463-497d-9056-491a47640d8a",
    "attributeNames" : [ ],
    "creationTime" : "2021-06-09T19:26:18.225Z",
    "lastAccessedTime" : "2021-06-10T07:25:33.225Z",
    "maxInactiveInterval" : 1800,
    "expired" : false
  }, {
    "id" : "642e84d6-5c2e-4359-b02f-6d13ec69977d",
    "attributeNames" : [ ],
    "creationTime" : "2021-06-10T05:26:18.226Z",
    "lastAccessedTime" : "2021-06-10T07:26:06.226Z",
    "maxInactiveInterval" : 1800,
    "expired" : false
  } ]
}
```
21.1.1. Query Parameters

The endpoint uses query parameters to limit the sessions that it returns. The following table shows the single required query parameter:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>username</td>
<td>Name of the user.</td>
</tr>
</tbody>
</table>

21.1.2. Response Structure

The response contains details of the matching sessions. The following table describes the structure of the response:

<table>
<thead>
<tr>
<th>Path</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sessions</td>
<td>Array</td>
<td>Sessions for the given username.</td>
</tr>
<tr>
<td>sessions[].id</td>
<td>String</td>
<td>ID of the session.</td>
</tr>
<tr>
<td>sessions[].attributeNames</td>
<td>Array</td>
<td>Names of the attributes stored in the session.</td>
</tr>
<tr>
<td>sessions[].creationTime</td>
<td>String</td>
<td>Timestamp of when the session was created.</td>
</tr>
<tr>
<td>sessions[].lastAccessedTime</td>
<td>String</td>
<td>Timestamp of when the session was last accessed.</td>
</tr>
<tr>
<td>sessions[].maxInactiveInterval</td>
<td>Number</td>
<td>Maximum permitted period of inactivity, in seconds, before the session will expire.</td>
</tr>
<tr>
<td>sessions[].expired</td>
<td>Boolean</td>
<td>Whether the session has expired.</td>
</tr>
</tbody>
</table>

21.2. Retrieving a Single Session

To retrieve a single session, make a GET request to /actuator/sessions/{id}, as shown in the following curl-based example:

```
$ curl 'http://localhost:8080/actuator/sessions/4db5efcc-99cb-4d05-a52c-b49acfb7ea9'
```

The preceding example retrieves the session with the id of 4db5efcc-99cb-4d05-a52c-b49acfb7ea9. The resulting response is similar to the following:
HTTP/1.1 200 OK
Content-Type: application/vnd.spring-boot.actuator.v3+json
Content-Length: 228

{
    "id" : "4db5efcc-99cb-4d05-a52c-b49acbfb7ea9",
    "attributeNames" : []
    "creationTime" : "2021-06-10T02:26:18.226Z",
    "lastAccessedTime" : "2021-06-10T07:25:41.226Z",
    "maxInactiveInterval" : 1800,
    "expired" : false
}

21.2.1. Response Structure

The response contains details of the requested session. The following table describes the structure of the response:

<table>
<thead>
<tr>
<th>Path</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>String</td>
<td>ID of the session.</td>
</tr>
<tr>
<td>attributeNames</td>
<td>Array</td>
<td>Names of the attributes stored in the session.</td>
</tr>
<tr>
<td>creationTime</td>
<td>String</td>
<td>Timestamp of when the session was created.</td>
</tr>
<tr>
<td>lastAccessedTime</td>
<td>String</td>
<td>Timestamp of when the session was last accessed.</td>
</tr>
<tr>
<td>maxInactiveInterval</td>
<td>Number</td>
<td>Maximum permitted period of inactivity, in seconds, before the session will expire.</td>
</tr>
<tr>
<td>expired</td>
<td>Boolean</td>
<td>Whether the session has expired.</td>
</tr>
</tbody>
</table>

21.3. Deleting a Session

To delete a session, make a DELETE request to /actuator/sessions/{id}, as shown in the following curl-based example:

```
$ curl 'http://localhost:8080/actuator/sessions/4db5efcc-99cb-4d05-a52c-b49acbfb7ea9'
-i -X DELETE
```

The preceding example deletes the session with the id of 4db5efcc-99cb-4d05-a52c-b49acbfb7ea9.
Chapter 22. Shutdown (shutdown)

The shutdown endpoint is used to shut down the application.

22.1. Shutting Down the Application

To shut down the application, make a POST request to /actuator/shutdown, as shown in the following curl-based example:

```
$ curl 'http://localhost:8080/actuator/shutdown' -i -X POST
```

A response similar to the following is produced:

```
HTTP/1.1 200 OK
Content-Type: application/vnd.spring-boot.actuator.v3+json
Content-Length: 41

{
   "message" : "Shutting down, bye..."
}
```

22.1.1. Response Structure

The response contains details of the result of the shutdown request. The following table describes the structure of the response:

<table>
<thead>
<tr>
<th>Path</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>String</td>
<td>Message describing the result of the request.</td>
</tr>
</tbody>
</table>
Chapter 23. Application Startup (startup)

The startup endpoint provides information about the application's startup sequence.

23.1. Retrieving the Application Startup steps

To drain and return the steps recorded so far during the application startup phase, make a POST request to /actuator/startup, as shown in the following curl-based example:

```bash
$ curl 'http://localhost:8080/actuator/startup' -i -X POST
```

The resulting response is similar to the following:
HTTP/1.1 200 OK
Content-Type: application/vnd.spring-boot.actuator.v3+json
Content-Length: 856

{
    "springBootVersion": "2.4.7-SNAPSHOT",
    "timeline": {
        "startTime": "2021-06-10T07:26:22.912Z",
        "events": [
            {
                "endTime": "2021-06-10T07:26:23.020Z",
                "duration": "PT0.001S",
                "startupStep": {
                    "name": "spring.beans.instantiate",
                    "id": 1,
                    "tags": [
                        {
                            "key": "beanName",
                            "value": "homeController"
                        }
                    ],
                    "parentId": 0
                },
                "startTime": "2021-06-10T07:26:23.019Z"
            },
            {
                "endTime": "2021-06-10T07:26:23.020Z",
                "duration": "PT0.003S",
                "startupStep": {
                    "name": "spring.boot.application.starting",
                    "id": 0,
                    "tags": [
                        {
                            "key": "mainApplicationClass",
                            "value": "com.example.startup.StartupApplication"
                        }
                    ],
                    "startTime": "2021-06-10T07:26:23.017Z"
                }
            }
        ]
    }
}

Each such call removes the returned steps from the buffer.

23.1.1. Response Structure

The response contains details of the application startup steps. The following table describes the structure of the response:

<table>
<thead>
<tr>
<th>Path</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>springBootVersion</td>
<td>String</td>
<td>Spring Boot version for this application.</td>
</tr>
<tr>
<td>timeline.startTime</td>
<td>String</td>
<td>Start time of the application.</td>
</tr>
<tr>
<td>Path</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>timeline.events</td>
<td>Array</td>
<td>An array of steps collected during application startup so far.</td>
</tr>
<tr>
<td>timeline.events[].startTime</td>
<td>String</td>
<td>The timestamp of the start of this event.</td>
</tr>
<tr>
<td>timeline.events[].endTime</td>
<td>String</td>
<td>The timestamp of the end of this event.</td>
</tr>
<tr>
<td>timeline.events[].duration</td>
<td>String</td>
<td>The precise duration of this event.</td>
</tr>
<tr>
<td>timeline.events[].startupStep.name</td>
<td>String</td>
<td>The name of the StartupStep.</td>
</tr>
<tr>
<td>timeline.events[].startupStep.id</td>
<td>Number</td>
<td>The id of this StartupStep.</td>
</tr>
<tr>
<td>timeline.events[].startupStep.parentId</td>
<td>Number</td>
<td>The parent id for this StartupStep.</td>
</tr>
<tr>
<td>timeline.events[].startupStep.tags</td>
<td>Array</td>
<td>An array of key/value pairs with additional step info.</td>
</tr>
<tr>
<td>timeline.events[].startupStep.tags[].key</td>
<td>String</td>
<td>The key of the StartupStep Tag.</td>
</tr>
<tr>
<td>timeline.events[].startupStep.tags[].value</td>
<td>String</td>
<td>The value of the StartupStep Tag.</td>
</tr>
</tbody>
</table>
Chapter 24. Thread Dump (threaddump)

The threaddump endpoint provides a thread dump from the application's JVM.

24.1. Retrieving the Thread Dump as JSON

To retrieve the thread dump as JSON, make a GET request to /actuator/threaddump with an appropriate Accept header, as shown in the following curl-based example:

```
$ curl 'http://localhost:8080/actuator/threaddump' -i -X GET \
-H 'Accept: application/json'
```

The resulting response is similar to the following:

```
HTTP/1.1 200 OK
Content-Type: application/json
Content-Length: 8282

24.1.1. Response Structure

The response contains details of the JVM's threads. The following table describes the structure of the response:

<table>
<thead>
<tr>
<th>Path</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>threads</td>
<td>Array</td>
<td>JVM's threads.</td>
</tr>
<tr>
<td>threads[].blockedCount</td>
<td>Number</td>
<td>Total number of times that the thread has been blocked.</td>
</tr>
<tr>
<td>threads[].blockedTime</td>
<td>Number</td>
<td>Time in milliseconds that the thread has spent blocked. -1 if thread contention monitoring is disabled.</td>
</tr>
<tr>
<td>threads[].daemon</td>
<td>Boolean</td>
<td>Whether the thread is a daemon thread. Only available on Java 9 or later.</td>
</tr>
<tr>
<td>threads[].inNative</td>
<td>Boolean</td>
<td>Whether the thread is executing native code.</td>
</tr>
<tr>
<td>threads[].lockName</td>
<td>String</td>
<td>Description of the object on which the thread is blocked, if any.</td>
</tr>
<tr>
<td>threads[].lockInfo</td>
<td>Object</td>
<td>Object for which the thread is blocked waiting.</td>
</tr>
<tr>
<td>threads[].lockInfo.className</td>
<td>String</td>
<td>Fully qualified class name of the lock object.</td>
</tr>
<tr>
<td>Path</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>---------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>threads[].lockInfo.identityHashCode</td>
<td>Number</td>
<td>Identity hash code of the lock object.</td>
</tr>
<tr>
<td>threads[].lockedMonitors</td>
<td>Array</td>
<td>Monitors locked by this thread, if any</td>
</tr>
<tr>
<td>threads[].lockedMonitors[].className</td>
<td>String</td>
<td>Class name of the lock object.</td>
</tr>
<tr>
<td>threads[].lockedMonitors[].identityHashCode</td>
<td>Number</td>
<td>Identity hash code of the lock object.</td>
</tr>
<tr>
<td>threads[].lockedMonitors[].lockedStackDepth</td>
<td>Number</td>
<td>Stack depth where the monitor was locked.</td>
</tr>
<tr>
<td>threads[].lockedMonitors[].lockedStackFrame</td>
<td>Object</td>
<td>Stack frame that locked the monitor.</td>
</tr>
<tr>
<td>threads[].lockedSynchronizers</td>
<td>Array</td>
<td>Synchronizers locked by this thread.</td>
</tr>
<tr>
<td>threads[].lockedSynchronizers[].className</td>
<td>String</td>
<td>Class name of the locked synchronizer.</td>
</tr>
<tr>
<td>threads[].lockedSynchronizers[].identityHashCode</td>
<td>Number</td>
<td>Identity hash code of the locked synchronizer.</td>
</tr>
<tr>
<td>threads[].lockOwnerId</td>
<td>Number</td>
<td>ID of the thread that owns the object on which the thread is blocked. -1 if the thread is not blocked.</td>
</tr>
<tr>
<td>threads[].lockOwnerName</td>
<td>String</td>
<td>Name of the thread that owns the object on which the thread is blocked, if any.</td>
</tr>
<tr>
<td>threads[].priority</td>
<td>Number</td>
<td>Priority of the thread. Only available on Java 9 or later.</td>
</tr>
<tr>
<td>threads[].stackTrace</td>
<td>Array</td>
<td>Stack trace of the thread.</td>
</tr>
<tr>
<td>threads[].stackTrace[].classLoaderName</td>
<td>String</td>
<td>Name of the class loader of the class that contains the execution point identified by this entry, if any. Only available on Java 9 or later.</td>
</tr>
<tr>
<td>threads[].stackTrace[].className</td>
<td>String</td>
<td>Name of the class that contains the execution point identified by this entry.</td>
</tr>
<tr>
<td>threads[].stackTrace[].fileName</td>
<td>String</td>
<td>Name of the source file that contains the execution point identified by this entry, if any.</td>
</tr>
<tr>
<td>Path</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>--------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>threads.[].stackTrace[].lineNumber</td>
<td>Number</td>
<td>Line number of the execution point identified by this entry. Negative if unknown.</td>
</tr>
<tr>
<td>threads.[].stackTrace[].methodName</td>
<td>String</td>
<td>Name of the method.</td>
</tr>
<tr>
<td>threads.[].stackTrace[].moduleName</td>
<td>String</td>
<td>Name of the module that contains the execution point identified by this entry, if any. Only available on Java 9 or later.</td>
</tr>
<tr>
<td>threads.[].stackTrace[].moduleVersion</td>
<td>String</td>
<td>Version of the module that contains the execution point identified by this entry, if any. Only available on Java 9 or later.</td>
</tr>
<tr>
<td>threads.[].stackTrace[].nativeMethod</td>
<td>Boolean</td>
<td>Whether the execution point is a native method.</td>
</tr>
<tr>
<td>threads.[].suspended</td>
<td>Boolean</td>
<td>Whether the thread is suspended.</td>
</tr>
<tr>
<td>threads.[].threadId</td>
<td>Number</td>
<td>ID of the thread.</td>
</tr>
<tr>
<td>threads.[].threadName</td>
<td>String</td>
<td>Name of the thread.</td>
</tr>
<tr>
<td>threads.[].threadState</td>
<td>String</td>
<td>State of the thread (NEW, RUNNABLE, BLOCKED, WAITING, TIMED_WAITING, TERMINATED).</td>
</tr>
<tr>
<td>threads.[].waitedCount</td>
<td>Number</td>
<td>Total number of times that the thread has waited for notification.</td>
</tr>
<tr>
<td>threads.[].waitedTime</td>
<td>Number</td>
<td>Time in milliseconds that the thread has spent waiting. -1 if thread contention monitoring is disabled</td>
</tr>
</tbody>
</table>

24.2. Retrieving the Thread Dump as Text

To retrieve the thread dump as text, make a GET request to /actuator/threaddump that accepts text/plain, as shown in the following curl-based example:

```
$ curl 'http://localhost:8080/actuator/threaddump' -i -X GET \
-H 'Accept: text/plain'
```

The resulting response is similar to the following:
Full thread dump OpenJDK 64-Bit Server VM (25.292-b10 mixed mode):
